PROJECT

B-12527

*Transformer from port of entry to foundation*

HLI railed this 293,252 Lb. unit from Laredo, TX to a rail siding in Goffs, CA, where HLI's crew received the unit to transport it to Boulder City, NV. After arriving at the rail siding, the transformer had to be offloaded from its heavy duty rail car to an over the road transport system to be delivered to the substation. The best choice for offloading this heavy transformer from the rail car and loading the large transporter

The crew jacked the transformer up off the railcar and used the slides to move the unit over to the special trailer. Once loaded to the transport trailer, the transformer was transported to its destination inside the substation. After a safe arrival at the substation location, it was removed from the transporter using the jack and slide system again. This put the transformer onto the final pad ready for assembly and installation. The job was completed on time and on budget.
